

Tufin Open Platform - TOP

TOP Alliance Program for Security Lifecycle Management

tufin

TOP Overview

To support rapidly changing business requirements, enterprise networks are continuously growing in terms of number of components and the rate at which changes are made to each component. Networks are also very diverse, made up of solutions from multiple vendors. Security administrators do not have an effective system for security policy management throughout the network. They monitor each network device separately, often through inaccurate, manual processes. This inevitably increases instances of network misconfiguration, which in turn increases exposure to security threats, regulatory compliance failures and downtime.

Security administrators require a unified platform for policy management, analysis and auditing throughout their networks.

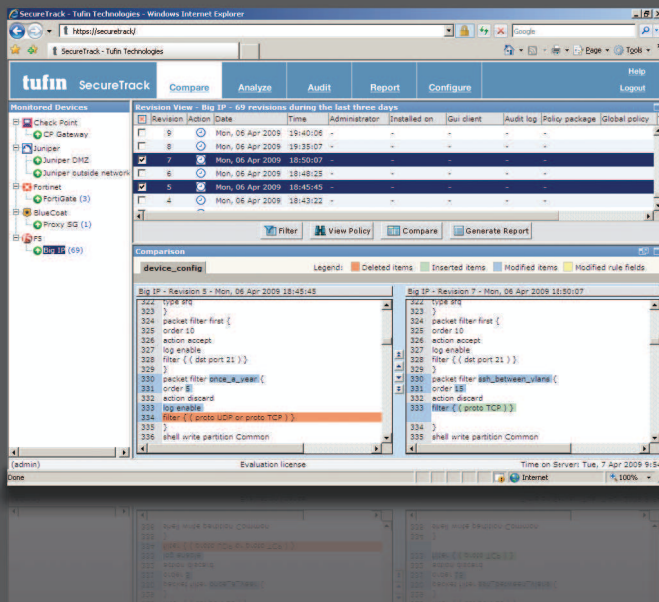

Tufin Open Platform (TOP) enables technology partners to easily integrate a wide range of network devices with Tufin's SecureTrack™ and SecureChange™ Workflow solutions. Through TOP, SecureTrack and SecureChange Workflow can be extended to provide automated policy management capabilities for any network device from any vendor.

How it Works

The TOP Alliance program provides technology partners and customers with a Software Development Kit (SDK) for TOP plugin development. The plugins implement the configuration retrieval logic for the network device that is integrated with Tufin's solutions and can be written in any programming language. Using TOP plugins, SecureTrack and SecureChange Workflow can be extended to support a variety of security and networking devices, enabling customers to leverage Tufin's unmatched Security Lifecycle Management capabilities to streamline operations. Tufin is currently partnered with Check Point, Cisco, Juniper, Fortinet, Blue Coat and F5.

TOP Features

- Comprehensive SDK that facilitates rapid Tufin plugin development
- Non-intrusive retrieval of current device configuration
- Support for all major programming and scripting languages
- Detailed documentation
- Technical support
- Plugin testing and certification program

TOP Benefits

- **Centralized change management of security and network devices:** SecureTrack and SecureChange Workflow can track and manage changes and maintain a comprehensive audit trail for a wide range of devices.
- **Consolidated automatic security audits:** Generate automated audit reports for all security and network devices from a single console.
- **Flexible, scalable platform:** Tufin products can be easily customized to support additional devices and vendors from a single interface.
- **Multi-vendor support:** Provides a unified view of devices from multiple vendors.
- **Open standards:** TOP is an open platform that enables customers, integrators, and vendors to develop plugins for Tufin solutions.
- **Simple, rapid development:** The TOP SDK provides developers with all the information they need to quickly develop plugins.

To participate in the TOP development program and receive the SDK, please contact us at top@tufin.com
